

Does hypochlorous work?

At the Ear Nose and Throat Institute, we've produced and staff tested a chlorine based solution that we call **GuardiENT**. It is produced by the electrolysis of water (H₂O) and salt (NaCl). The generated result is a mildly acidic form of chlorine known as Hypochlorous Acid (HOCl) which happens to be the foundation of the human immune system. It is reported that the neutrophils in our blood when activated are estimated to produce over 1 million HOCl molecules per second to fight invading pathogens and infections.

Our HOCl spray solution is essentially the human immune system in a bottle!

Many studies have shown that hypochlorous is very effective against pathogens and infections. [Click here](#) to access a digest of scientific studies.
